## RESTARTING A REMOTE MACHINE

**For Automation Geeks** | By Bharat Kakkar

**M**any of us use virtual machines for creating test environment and thus testing the applications.

In most cases we use Microsoft terminal services i.e. “**mstsc**” to access the remote machine, but restarting a remote machine still seems to be a concern area for most of the testers. Let us see how easily we can do this in real time.

### Accessing the remote machine using Microsoft terminal services

You may click on options to set the remote machine's option like opening the machine in full screen mode.

## About the command

**MSTSC** [<connection file>] [/v:<server[:port]>] [/admin] [/f[ullscreen]] [/w:<width> /h:<height>] [/public] | [/span] [/multimon] [/migrate] [/edit "connection file"]

**"connection file"** -- Specifies the name of an .RDP file for the connection.

**/v:<server[:port]>** -- Specifies the remote computer to which you want to connect.

**/admin** -- Connects you to the session for administering a server.

**/f** -- Starts Remote Desktop in full-screen mode.

**/w:<width>** -- Specifies the width of the Remote Desktop window.

**/h:<height>** -- Specifies the height of the Remote Desktop window.

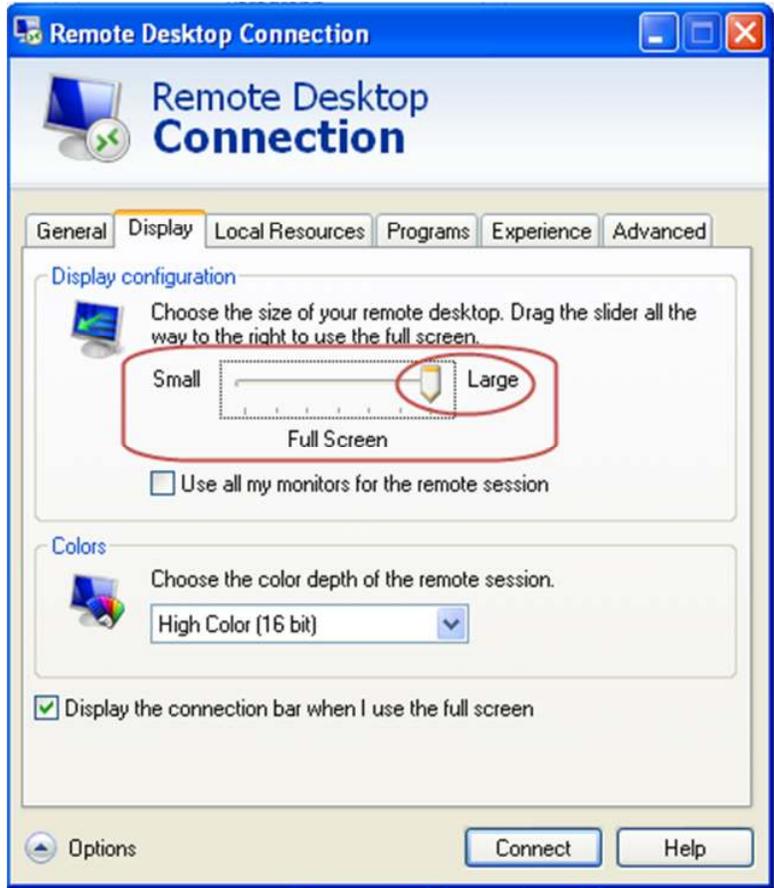

**/public** -- Runs Remote Desktop in public mode.

**/span** -- Matches the remote desktop width and height with the local virtual desktop, spanning across multiple monitors, if necessary. To span across monitors, the monitors must be arranged to form a rectangle.

**/multimon** -- Configures the remote desktop session monitor layout to be identical to the current client-side configuration.

**/edit** -- Opens the specified .RDP connection file for editing.

**/migrate** -- Migrates legacy connection files that were created with Client Connection Manager to new .RDP connection files.

### Restarting the remote machine

The trick is to use **Alt+Ctrl+End** instead of **Alt+Ctrl+Delete**

Click on **OK** and wait for machine to get re-started.
